Executive Summary

This Software Requirements Specification (SRS) document defines the design and functional scope of a machine learning-based phishing detection system that classifies URLs as either malicious or legitimate using URL-string-derived features exclusively. The system is designed as a standalone, offline pipeline, with no reliance on external services, live network queries, or third-party reputation systems during execution.

The system supports the study of phishing detection using URL-derived features under strict operational constraints, including air-gapped deployment, privacy preservation, and independence from external data sources. While existing phishing detection systems often achieve strong performance, many depend on supplementary inputs such as Domain Name System (DNS) queries, WHOIS data, webpage content analysis, or cloud-based threat intelligence feeds. These dependencies introduce limitations related to data exposure, reproducibility, and deployability in restricted environments.

To investigate this problem, the system extracts a defined set of lexical features from URLs and applies multiple supervised machine learning classifiers. The classification outputs are aggregated using a majority voting ensemble mechanism, enabling comparative analysis of individual model performance and overall system resilience. The pipeline supports end-to-end experimentation, including dataset construction, preprocessing, feature extraction, model training, and cross-dataset evaluation.

The primary contribution of this work is the development of a constrained experimental framework for the systematic evaluation of phishing detection performance in a fully offline, privacy-preserving, and lightweight environment. Rather than introducing a novel algorithm, this project focuses on analyzing the effectiveness and limitations of URL-only detection when external data sources are intentionally excluded.

This SRS document outlines the system's functional requirements, data structures, processing workflow, and operational constraints. The implementation is intended as a research-oriented prototype designed to support empirical evaluation, reproducibility, and controlled experimentation. The results of this system aim to contribute to cybersecurity research by examining the trade-offs between detection accuracy, generalization, privacy preservation, and system independence.

Table of Contents

1. Introduction	6
1.1 Purpose	6
1.2 Scope	7
1.3 Overview	8
2. Overall Description	9
2.1 Product Perspective	9
2.2 Product Functions	10
2.3 User Classes & Characteristics	12
2.4 Operating Environment	24
2.5 Design & Implementation Constraints	25
2.6 Assumptions & Dependencies	26
3. Software Architecture	28
3.1 Architectural Overview	28
3.2 Systems Architecture Diagram	32
3.3 Architectural Components	33
3.4 Integration Layer	35
3.5 Technology Stack	36
3.6 Data Architecture	37
3.7 Security Architecture	39
3.8 Integration Architecture	40
3.9 Scalability & Performance Architecture	41
4. Software Features & Requirements	42
4.1 Functional Requirements	42
4.2 External Interface Requirements	48
4.3 Non-Functional Requirements	50
4.4 Security Requirements	53
4.5 Software Quality Attributes	55
5. Software Models	58

5.1 Use Case Diagrams	58
5.2 Activity Diagrams	59
5.3 Sequence Diagrams	60
5.4 Class Diagrams	61
5.5 State Diagrams	62
5.6 Entity-Relationship Diagrams	63
5.7 Wireframe/Prototypes	64
6. Data Requirements	65
6.1 Logical Data Model	65
6.2 Data Dictionary	66
6.3 Data Retention	69
6.4 Data Migration	70
6.5 Backup & Recovery	70
7. Other Software Requirements	70
7.1 Internationalization & Localization	71
7.2 Installation & Deployment	71
7.3 Licensing Requirements	72
7.4 Legal & Regulatory Requirements	72
7.5 Documentation Requirements	73
8. Appendices	74
Appendix A: Detailed Architecture Diagrams	74
Appendix B: Technical Specifications and Algorithmic Details	83
Appendix C: User Interface Prototype	89
Appendix D: Sample Inputs/Outputs, Test Scenarios	94
Appendix E: Definitions, Acronyms, and Abbreviations	112
Appendix F: References	114
Appendix G: AI Use	116
